# Introduction - Design

Shape Design Mesh Movement<sup>1</sup>

Lift/Drag Objective Function<sup>1</sup>

- Exploring design space using high-fidelity CFD is challenging
- zero-order methods (sampling) are prohibitively expensive
- Need to be intelligent about techniques for evaluating sensitivity to design parameters
- Gradient-based optimization much more efficient than sampling, but requires calculating sensitivity derivatives

<sup>1</sup>Credit: FUN3D Tutorial Examples.

# Introduction - Design

- **> 100 design variables** in OM6 wing shape optimization

# Introduction - Design

- **> 100 design variables** in OM6 wing shape optimization
- How do you to compute sensitivity of that many DVs?

# Introduction - Design

- > **100 design variables** in OM6 wing shape optimization
- How do you to compute sensitivity of that many DVs?

## Direct differentiation approach - Expensive

- Navier-Stokes equations can be directly differentiated to yield sensitivity derivatives necessary for gradient-based optimization
- Finite difference requires a minimum of **one flow solution for each design variable sensitivity**
- Prohibitively expensive for large number of design parameters

# Introduction - Design

- **> 100 design variables** in OM6 wing shape optimization
- How do you to compute sensitivity of that many DVs?

## Adjoint approach - More efficient

- Solve adjoint equations in addition to Navier Stokes flow equations to obtain sensitivity derivatives
- **One flow and adjoint solution needed for each cost function**, regardless of number of design variables
- Considerably more efficient than direct differentiation approach for large number of design parameters

# Introduction - Design

- Adjoint-based design optimization has received considerable attention in compressible, perfect gas CFD solvers<sup>2,3</sup>, but very little in reacting flow solvers
- Difficulty of adjoint approach lies in implementing exact linearizations for 2nd-order flux construction scheme
- Particularly difficult for reacting flows, due to
  - complexity of linearizing the additional equations for multi-species chemical kinetics
  - Resorting to Automatic Differentiation tools is a performance overhead that is implementation-specific<sup>4</sup>
  - Serious memory and computational cost concerns when simulating a large number of species

# Introduction - Improvement to State of the Art

- Current state of the art
  - Attempts made at both continuous<sup>5</sup> and discrete<sup>6</sup> adjoint formulations for a compressible reacting flow solver
  - These attempts suffer from quadratic scaling in memory and computational cost with number of species
  - Recent scheme at Barcelona Supercomputing Center<sup>7</sup> is promising, but only for incompressible reacting flows
- Proposed improvement to the state of the art
  - New decoupled scheme for both hypersonic flow solver and adjoint solver that is robust for high-speed flows in chemical non-equilibrium
  - New scheme significantly improves scaling in computational cost and memory with number of species

# Introduction - Decoupled Approach

- Reacting gas simulations require solving a large number of conservation equations
- Memory concerns
  - Size of Jacobians scales quadratically with number species in gas mixture
  - Solving system of equations in a tightly-coupled fashion can be limited by memory constraints
- Cost concerns
  - Cost of solving the linear system scales quadratically with number of species in gas mixture
- Efficiently solving adjoint problem is a primary motivator
  - Solving adjoint system particularly costly if linear solver is slow
  - Can be necessary to store jacobian twice → large memory overhead

# Introduction - Decoupled Approach

- Loosely-coupled solvers have become popular in the combustion community<sup>8</sup>
  - Decouple species conservation equations from meanflow equations, and solve two smaller systems

$$\begin{pmatrix} \square & \square & \dots & \square \\ \square & \square & \dots & \vdots \\ \vdots & \vdots & \ddots & \vdots \\ \square & \dots & \dots & \square \end{pmatrix} \rightarrow \begin{pmatrix} \square & \dots & \square \\ \vdots & \ddots & \vdots \\ \square & \dots & \square \end{pmatrix}_{5 \times 5} \text{ and } \begin{pmatrix} \square & \boxtimes & \dots & \boxtimes \\ \boxtimes & \square & \dots & \vdots \\ \vdots & \vdots & \ddots & \vdots \\ \boxtimes & \dots & \dots & \square \end{pmatrix}_{ns \times ns}$$

- Candler, et al.<sup>9</sup> originally derived this for Steger-Warming scheme, this work extends to Roe FDS scheme

# Introduction - Choice of Code and Implementation

- FUN3D chosen as code to facilitate all research presented, because
  - Excellent infrastructure for adjoint-based design analysis and optimization
  - Robust hypersonic flow solver
  - NASA Langley Research Center supporting me through the Pathways program
- Decision to pursue discrete adjoint, rather than continuous adjoint, due to current FUN3D implementation

# Outline

- 4 Adjoint Solver
  - Derivation of Discrete Adjoint Formulation
  - Fully Coupled Iterative Method
  - Decoupled Iterative Method
- 5 Design Problem
- 6 Concluding Remarks

# Fully-Coupled Point Implicit Method

- All work presented is for inviscid flows in chemical non-equilibrium, using a one-temperature model, but is extendable to viscous flows.
- Beginning with the semi-discrete form

$$\frac{\partial \mathbf{U}}{\partial t} + \frac{1}{V} \sum_f (\mathbf{F} \cdot \mathbf{S})^f = \mathbf{W}$$

$$\mathbf{U} = \begin{pmatrix} \rho_1 \\ \vdots \\ \rho_{ns} \\ \rho u \\ \rho v \\ \rho w \\ \rho E \end{pmatrix}, \quad \mathbf{F} \cdot \mathbf{S} = \begin{pmatrix} \rho_1 \bar{U} \\ \vdots \\ \rho_{ns} \bar{U} \\ \rho u \bar{U} + p s_x \\ \rho u \bar{U} + p s_y \\ \rho u \bar{U} + p s_z \\ (\rho E + p) \bar{U} \end{pmatrix} S, \quad \mathbf{W} = \begin{pmatrix} \dot{\rho}_1 \\ \vdots \\ \dot{\rho}_{ns} \\ 0 \\ 0 \\ 0 \\ 0 \end{pmatrix}$$

# Fully-Coupled Point Implicit Method

- Using the Roe FDS scheme to compute the inviscid flux at the face,  $\mathbf{F}^f$ , and linearizing the system results in

$$\frac{\delta \mathbf{U}^n}{\Delta t} + \frac{1}{V} \sum_f \left( \frac{\partial \mathbf{F}^f}{\partial \mathbf{U}^L} \delta \mathbf{U}^L + \frac{\partial \mathbf{F}^f}{\partial \mathbf{U}^R} \delta \mathbf{U}^R \right)^n \mathbf{S}^f - \frac{\partial \mathbf{W}}{\partial \mathbf{U}} \delta \mathbf{U}^n$$

$$= -\frac{1}{V} \sum_f (\mathbf{F}^f \cdot \mathbf{S}^f)^n + \mathbf{W}^n$$

- Which can be thought of more simply as

$$\mathbf{A} \mathbf{u} = \mathbf{b}$$

$$\mathbf{A} \rightarrow \begin{matrix} (4 + ns) \times (4 + ns) \\ \text{Jacobian Block} \end{matrix}$$

$$\mathbf{b} \rightarrow \begin{matrix} (4 + ns) \times 1 \\ \text{Residual} \end{matrix}$$

# Fully-Coupled Point Implicit Method

- Constructing the Jacobian in a fully-coupled fashion results in large, dense block matrices
- Using a stationary iterative method (i.e., Gauss-Seidel, SSOR, etc.), work is dominated by matrix-vector products

$$\text{Cost} \rightarrow O((4 + ns)^2)$$

- Leads to onerous quadratic scaling with respect to number of species

# Decoupled Point Implicit Method

- The main idea is to separate the meanflow and species composition equations, adding a new equation for the total mixture density
- Leads to two sets of conserved variables

$$\mathbf{U}' = \begin{pmatrix} \rho \\ \rho u \\ \rho v \\ \rho w \\ \rho E \end{pmatrix} \quad \hat{\mathbf{U}} = \begin{pmatrix} \rho_1 \\ \vdots \\ \rho_{ns} \end{pmatrix}$$

Meanflow

Species Composition

# Decoupled Point Implicit Method

- The fluxes are solved in two sequential steps
  - The mixture fluxes are first solved as

$$\frac{\partial \mathbf{U}'}{\partial t} + \frac{1}{V} \sum_f (\mathbf{F}' \cdot \mathbf{S})^f = 0$$

- Followed by the species fluxes

$$\frac{\partial \hat{\mathbf{U}}}{\partial t} + \frac{1}{V} \sum_f (\hat{\mathbf{F}} \cdot \mathbf{S})^f = \hat{\mathbf{W}}$$

- Since the mixture density was determined in the first step, step two actually solves for the species mass fractions

$$\delta \hat{\mathbf{U}}^n = \rho^{n+1} \hat{\mathbf{V}}^{n+1} - \rho^n \hat{\mathbf{V}}^n = \rho^{n+1} \delta \hat{\mathbf{V}}^n + \hat{\mathbf{V}}^n \delta \rho^n$$

$$\hat{\mathbf{V}} = (c_1, \dots, c_{ns})^T, c_s = \rho_s / \rho$$

# Decoupled Point Implicit Method

- The Roe FDS scheme species mass fluxes can be rewritten as

$$\hat{\mathbf{F}}_{\rho_s} = c_s \mathbf{F}'_{\rho} + (c_s^L - \tilde{c}_s) \rho^L \lambda^+ + (c_s^R - \tilde{c}_s) \rho^R \lambda^-$$

$$\frac{\partial \hat{\mathbf{F}}_{\rho_s}}{\partial c_s^L} = w \mathbf{F}_{\rho} + (1 - w) \rho^L \lambda^+ - w \rho^R \lambda^-$$

$$\frac{\partial \hat{\mathbf{F}}_{\rho_s}}{\partial c_s^R} = (1 - w) \mathbf{F}_{\rho} + (w - 1) \rho^L \lambda^+ + w \rho^R \lambda^-$$

- Jacobian Approximations

Step 1:  $\left. \frac{\partial \mathbf{F}}{\partial \mathbf{U}'} \right|_{\hat{\mathbf{V}}} = 5 \times 5 \text{ Roe FDS Jacobian}_{c_s=\text{Constant}}$

Step 2:  $\left. \frac{\partial \mathbf{F}}{\partial \hat{\mathbf{V}}} \right|_{\hat{\mathbf{U}}'} = \begin{pmatrix} \frac{\partial F_{\rho_1}}{\partial c_1} & & 0 \\ & \ddots & \\ 0 & & \frac{\partial F_{\rho_{ns}}}{\partial c_{ns}} \end{pmatrix}$

# Decoupled Point Implicit Method

- Chemical source term linearized via

$$\hat{\mathbf{W}}^{n+1} = \hat{\mathbf{W}}^n + \left. \frac{\partial \hat{\mathbf{W}}}{\partial \mathbf{U}} \right|_{\mathbf{U}'} \frac{\partial \mathbf{U}}{\partial \hat{\mathbf{V}}}$$

$$\mathbf{C} = \left. \frac{\partial \hat{\mathbf{W}}}{\partial \mathbf{U}} \right|_{\mathbf{U}'} \frac{\partial \mathbf{U}}{\partial \hat{\mathbf{V}}}$$

- Full system to be solved in step two

$$\rho^{n+1} \frac{\delta \hat{\mathbf{V}}^n}{\Delta t} + \frac{1}{V} \sum_f \left( \frac{\partial \hat{\mathbf{F}}^f}{\partial \mathbf{V}^L} \delta \mathbf{V}^L + \frac{\partial \hat{\mathbf{F}}^f}{\partial \hat{\mathbf{V}}^R} \delta \hat{\mathbf{V}}^R \right)^{n,n+1} \mathbf{S}^f - \mathbf{C}^{n,n+1} \delta \mathbf{V}^n$$

$$= -\frac{1}{V} \sum_f (\hat{\mathbf{F}}^{n,n+1} \cdot \mathbf{S})^f + \mathbf{W}^{n,n+1} - \hat{\mathbf{V}}^n \frac{\delta \rho^n}{\Delta t} - R_\rho$$

$$R_\rho = -\frac{1}{V} \sum_f \sum_s (\hat{F}_{\rho_s}^{n,n+1} \cdot \mathbf{S})$$

- $R_\rho$  is included to preserve  $\sum_s c_s = 1$ ,  $\sum_s \delta c_s = 0$ .

# Outline

- 1 Introduction

- 4 Adjoint Solver
  - Derivation of Discrete Adjoint Formulation
  - Fully Coupled Iterative Method
  - Decoupled Iterative Method
- 5 Design Problem
- 6 Concluding Remarks

# Cost and Memory Savings of the Decoupled Flow Solver

- Most significant savings comes from the source term linearization being purely node-based
  - Convective contributions to block Jacobians are diagonal
  - Source term jacobian is dense block Jacobian
  - In the global system (w/chemistry), all off-diagonal block jacobians are diagonal

$$\begin{pmatrix} \square & & & \\ & \ddots & & \\ & & \square & \\ & & & \ddots \\ & & & & \square \end{pmatrix} \begin{pmatrix} \delta \hat{\mathbf{V}}_1 \\ \vdots \\ \delta \hat{\mathbf{V}}_i \\ \vdots \\ \delta \hat{\mathbf{V}}_{nodes} \end{pmatrix} = \begin{pmatrix} \hat{b}_1 \\ \vdots \\ \hat{b}_i \\ \vdots \\ \hat{b}_{nodes} \end{pmatrix} - \begin{pmatrix} (\sum_{j=1}^{N_{nb}} [\mathcal{N}] \delta \hat{\mathbf{V}}_j)_1 \\ \vdots \\ (\sum_{j=1}^{N_{nb}} [\mathcal{N}] \delta \hat{\mathbf{V}}_j)_i \\ \vdots \\ (\sum_{j=1}^{N_{nb}} [\mathcal{N}] \delta \hat{\mathbf{V}}_j)_{nodes} \end{pmatrix}$$

- Matrix-vector products  $\rightarrow$  inner products:  $O(ns^2) \rightarrow O(ns)$

# Cost and Memory Savings of the Decoupled Flow Solver

- Comparing size of Jacobian systems, using Compressed Row Storage

$\mathbf{A}_d$  = Decoupled system Jacobians

$\mathbf{A}$  = Fully-coupled system Jacobians

$$\begin{aligned}
 \text{Relative Memory Cost} &= \frac{\text{size}(\mathbf{A}_d)}{\text{size}(\mathbf{A})} \\
 &= \lim_{ns \rightarrow \infty} \frac{(ns^2 + 5^2)(N_{nodes}) + (ns + 5^2)(N_{nbrs})}{(ns + 4)^2(N_{nodes} + N_{nbrs})} \\
 &= \frac{N_{nodes}}{N_{nodes} + N_{nbrs}}
 \end{aligned}$$

## Numerical Results: 2D Cylinder

- Fully-coupled and decoupled methods both implemented in the Generic Gas Path of FUN3D
- Tested on 2D cylinder case
  - $V_{\infty} = 5000 \text{ m/s}$ ,  $\rho_{\infty} = 0.001 \text{ kg/m}^3$ , and  $T_{\infty} = 200 \text{ K}$
- Inviscid flow, with 1-Temperature model

# Numerical Results: 2D Cylinder

- Verification of implementation
  - 5-species air model: N, N<sub>2</sub>, O, O<sub>2</sub>, and NO with five reactions

- Surface pressure, surface temperature, and mass fractions on stagnation line agree between decoupled and fully coupled implementations

# Numerical Results: 2D Cylinder

- On structured grids  $N_{nbrs} \approx 6N_{nodes}$ 
  - Half precision off-diagonal  $N_{nbrs} = \frac{6N_{nodes}}{2}$

$$Memory\ Cost \approx \frac{N_{nodes}}{N_{nodes} + N_{nbrs}} = \frac{N_{nodes}}{N_{nodes} + 6N_{nodes}/2} = \frac{1}{4}$$

- Linear speedup in solver:  $\frac{O(ns^2)}{O(ns)} = O(ns)$

# Numerical Results: Axisymmetric Spherically Capped Cone

- Verify that the decoupled scheme is robust at high velocities
  - $V_{\infty} = 15000 \text{ m/s}$ ,  $\rho_{\infty} = 0.001 \text{ kg/m}^3$ ,  $T_{\infty} = 200 \text{ K}$ .
  - 11-species air model N, N<sub>2</sub>, O, O<sub>2</sub>, NO, N<sup>+</sup>, N<sub>2</sub><sup>+</sup>, O<sup>+</sup>, O<sub>2</sub><sup>+</sup>, NO<sup>+</sup>, and electrons, with 22 possible reactions.

# Numerical Results: Axisymmetric Spherically Capped Cone

- Surface pressure and surface temperature agree between decoupled and fully coupled implementations

# Numerical Results: Axisymmetric Spherically Capped Cone

- Necessary to scale source term magnitude by  $0.001 \leq w \leq 1$  for the first 500 iterations, due to extreme reaction rates
- Both schemes converge in a similar number of iterations
- Decoupled scheme  $\approx 2\times$  faster

# Outline

- 1 Introduction
- 2 Flow Solver
  - Fully-Coupled Method
  - Decoupled Method

  - Fully Coupled Iterative Method
  - Decoupled Iterative Method
- 5 Design Problem
- 6 Concluding Remarks

# Derivation of Discrete Adjoint Formulation

- The derivation of the adjoint approach to compute design sensitivities begins with forming the Lagrangian and differentiating with respect to the design variables

$$L(\mathbf{D}, \mathbf{Q}, \mathbf{X}, \mathbf{\Lambda}) = f(\mathbf{D}, \mathbf{Q}, \mathbf{X}) + \mathbf{\Lambda}^T \mathbf{R}(\mathbf{D}, \mathbf{Q}, \mathbf{X})$$

$\mathbf{D}$  = design variables

$f$  = cost function

$\mathbf{Q}$  = flow variables

$\mathbf{R}$  = flow residual

$\mathbf{X}$  = computational grid

$\mathbf{\Lambda}$  = costate variables

# Derivation of Discrete Adjoint Formulation

- The derivation of the adjoint approach to compute design sensitivities begins with forming the Lagrangian and differentiating with respect to the design variables

$$L(\mathbf{D}, \mathbf{Q}, \mathbf{X}, \boldsymbol{\Lambda}) = f(\mathbf{D}, \mathbf{Q}, \mathbf{X}) + \boldsymbol{\Lambda}^T \mathbf{R}(\mathbf{D}, \mathbf{Q}, \mathbf{X})$$

$$\begin{aligned} \frac{\partial L}{\partial \mathbf{D}} = & \left\{ \frac{\partial f}{\partial \mathbf{D}} + \left[ \frac{\partial \mathbf{X}}{\partial \mathbf{D}} \right]^T \frac{\partial f}{\partial \mathbf{X}} \right\} + \left[ \frac{\partial \mathbf{Q}}{\partial \mathbf{D}} \right]^T \left\{ \frac{\partial f}{\partial \mathbf{Q}} + \left[ \frac{\partial \mathbf{R}}{\partial \mathbf{Q}} \right]^T \boldsymbol{\Lambda} \right\} \\ & + \left\{ \left[ \frac{\partial \mathbf{R}}{\partial \mathbf{D}} \right]^T + \left[ \frac{\partial \mathbf{X}}{\partial \mathbf{D}} \right]^T \left[ \frac{\partial \mathbf{R}}{\partial \mathbf{X}} \right]^T \right\} \boldsymbol{\Lambda} \end{aligned}$$

$\mathbf{D}$  = design variables

$f$  = cost function

$\mathbf{Q}$  = flow variables

$\mathbf{R}$  = flow residual

$\mathbf{X}$  = computational grid

$\boldsymbol{\Lambda}$  = costate variables

# Derivation of Discrete Adjoint Formulation

- The derivation of the adjoint approach to compute design sensitivities begins with forming the Lagrangian and differentiating with respect to the design variables

$$L(\mathbf{D}, \mathbf{Q}, \mathbf{X}, \boldsymbol{\Lambda}) = f(\mathbf{D}, \mathbf{Q}, \mathbf{X}) + \boldsymbol{\Lambda}^T \mathbf{R}(\mathbf{D}, \mathbf{Q}, \mathbf{X})$$

$$\frac{\partial L}{\partial \mathbf{D}} = \left\{ \frac{\partial f}{\partial \mathbf{D}} + \left[ \frac{\partial \mathbf{X}}{\partial \mathbf{D}} \right]^T \frac{\partial f}{\partial \mathbf{X}} \right\} + \left[ \frac{\partial \mathbf{Q}}{\partial \mathbf{D}} \right]^T \left\{ \frac{\partial f}{\partial \mathbf{Q}} + \left[ \frac{\partial \mathbf{R}}{\partial \mathbf{Q}} \right]^T \boldsymbol{\Lambda} \right\} + \left\{ \left[ \frac{\partial \mathbf{R}}{\partial \mathbf{D}} \right]^T + \left[ \frac{\partial \mathbf{X}}{\partial \mathbf{D}} \right]^T \left[ \frac{\partial \mathbf{R}}{\partial \mathbf{X}} \right]^T \right\} \boldsymbol{\Lambda}$$

$\mathbf{D}$  = design variables

$f$  = cost function

$\mathbf{Q}$  = flow variables

$\mathbf{R}$  = flow residual

$\mathbf{X}$  = computational grid

$\boldsymbol{\Lambda}$  = costate variables

# Derivation of Discrete Adjoint Formulation

- Need to eliminate flow variable dependence on design variables,  $\frac{\partial \mathbf{Q}}{\partial \mathbf{D}}$
- Adjoint equation

$$\left[ \frac{\partial \mathbf{R}}{\partial \mathbf{Q}} \right]^T \boldsymbol{\Lambda} = -\frac{\partial f}{\partial \mathbf{Q}}$$

- Solve for  $\boldsymbol{\Lambda}$  and compute sensitivity derivatives

$$\frac{\partial L}{\partial \mathbf{D}} = \left\{ \frac{\partial f}{\partial \mathbf{D}} + \left[ \frac{\partial \mathbf{X}}{\partial \mathbf{D}} \right]^T \frac{\partial f}{\partial \mathbf{X}} \right\} + \left\{ \left[ \frac{\partial \mathbf{R}}{\partial \mathbf{D}} \right]^T + \left[ \frac{\partial \mathbf{X}}{\partial \mathbf{D}} \right]^T \left[ \frac{\partial \mathbf{R}}{\partial \mathbf{X}} \right]^T \right\} \boldsymbol{\Lambda}$$

# Fully Coupled Iterative Method

- Adjoint problem is a linear system

$$\begin{pmatrix} \frac{\partial \mathbf{R}_{\rho i}}{\partial \rho_j}^T & \frac{\partial \mathbf{R}_{\rho i}}{\partial \rho \mathbf{u}}^T & \frac{\partial \mathbf{R}_{\rho i}}{\partial \rho E}^T \\ \frac{\partial \mathbf{R}_{\rho u}}{\partial \rho_j}^T & \frac{\partial \mathbf{R}_{\rho u}}{\partial \rho \mathbf{u}}^T & \frac{\partial \mathbf{R}_{\rho u}}{\partial \rho E}^T \\ \frac{\partial \mathbf{R}_{\rho E}}{\partial \rho_j}^T & \frac{\partial \mathbf{R}_{\rho E}}{\partial \rho \mathbf{u}}^T & \frac{\partial \mathbf{R}_{\rho E}}{\partial \rho E}^T \end{pmatrix} \begin{pmatrix} \Lambda_{\rho i} \\ \Lambda_{\rho u} \\ \Lambda_{\rho E} \end{pmatrix} = - \begin{pmatrix} \frac{\partial f}{\partial \rho_i} \\ \frac{\partial f}{\partial \rho u} \\ \frac{\partial f}{\partial \rho E} \end{pmatrix}$$

- Can be solved with Krylov method (i.e. GMRES), but time marching similar to flow solver shown to be more robust

$$\left( \frac{V}{\Delta t} \mathbf{I} + \frac{\partial \mathbf{R}_1}{\partial \mathbf{Q}} \right) \Delta \Lambda = - \frac{\partial f}{\partial \mathbf{Q}} - \frac{\partial \mathbf{R}_2}{\partial \mathbf{Q}}^T \Lambda$$

- Straightforward to formulate, but cost and memory requirements scale quadratically with number of species

# Decoupled Iterative Method

- Rewrite conserved variables similar to decoupled flow solver

$$\begin{pmatrix} \frac{\partial \mathbf{R}_\rho}{\partial \rho}^T & \frac{\partial \mathbf{R}_\rho}{\partial \rho \mathbf{u}}^T & \frac{\partial \mathbf{R}_\rho}{\partial \rho E}^T & \frac{\partial \mathbf{R}_\rho}{\partial c_s}^T \\ \frac{\partial \mathbf{R}_{\rho \mathbf{u}}}{\partial \rho}^T & \frac{\partial \mathbf{R}_{\rho \mathbf{u}}}{\partial \rho \mathbf{u}}^T & \frac{\partial \mathbf{R}_{\rho \mathbf{u}}}{\partial \rho E}^T & \frac{\partial \mathbf{R}_{\rho \mathbf{u}}}{\partial c_s}^T \\ \frac{\partial \mathbf{R}_{\rho E}}{\partial \rho}^T & \frac{\partial \mathbf{R}_{\rho E}}{\partial \rho \mathbf{u}}^T & \frac{\partial \mathbf{R}_{\rho E}}{\partial \rho E}^T & \frac{\partial \mathbf{R}_{\rho E}}{\partial c_s}^T \\ \frac{\partial \mathbf{R}_{\rho s}}{\partial \rho}^T & \frac{\partial \mathbf{R}_{\rho s}}{\partial \rho \mathbf{u}}^T & \frac{\partial \mathbf{R}_{\rho s}}{\partial \rho E}^T & \frac{\partial \mathbf{R}_{\rho s}}{\partial c_s}^T \end{pmatrix} \begin{pmatrix} \Lambda_\rho \\ \Lambda_{\rho \mathbf{u}} \\ \Lambda_{\rho E} \\ \Lambda_{c_s} \end{pmatrix} = - \begin{pmatrix} \frac{\partial f}{\partial \rho} \\ \frac{\partial f}{\partial \rho \mathbf{u}} \\ \frac{\partial f}{\partial \rho E} \\ \frac{\partial f}{\partial c_s} \end{pmatrix}$$

# Decoupled Iterative Method

- Rewrite conserved variables similar to decoupled flow solver

$$\begin{pmatrix} \frac{\partial \mathbf{R}_\rho}{\partial \rho}^T & \frac{\partial \mathbf{R}_\rho}{\partial \rho \mathbf{u}}^T & \frac{\partial \mathbf{R}_\rho}{\partial \rho E}^T & \frac{\partial \mathbf{R}_\rho}{\partial c_s}^T \\ \frac{\partial \mathbf{R}_{\rho \mathbf{u}}}{\partial \rho}^T & \frac{\partial \mathbf{R}_{\rho \mathbf{u}}}{\partial \rho \mathbf{u}}^T & \frac{\partial \mathbf{R}_{\rho \mathbf{u}}}{\partial \rho E}^T & \frac{\partial \mathbf{R}_{\rho \mathbf{u}}}{\partial c_s}^T \\ \frac{\partial \mathbf{R}_{\rho E}}{\partial \rho}^T & \frac{\partial \mathbf{R}_{\rho E}}{\partial \rho \mathbf{u}}^T & \frac{\partial \mathbf{R}_{\rho E}}{\partial \rho E}^T & \frac{\partial \mathbf{R}_{\rho E}}{\partial c_s}^T \\ \frac{\partial \mathbf{R}_{\rho s}}{\partial \rho}^T & \frac{\partial \mathbf{R}_{\rho s}}{\partial \rho \mathbf{u}}^T & \frac{\partial \mathbf{R}_{\rho s}}{\partial \rho E}^T & \frac{\partial \mathbf{R}_{\rho s}}{\partial c_s}^T \end{pmatrix} \begin{pmatrix} \Lambda_\rho \\ \Lambda_{\rho \mathbf{u}} \\ \Lambda_{\rho E} \\ \Lambda_{c_s} \end{pmatrix} = - \begin{pmatrix} \frac{\partial f}{\partial \rho} \\ \frac{\partial f}{\partial \rho \mathbf{u}} \\ \frac{\partial f}{\partial \rho E} \\ \frac{\partial f}{\partial c_s} \end{pmatrix}$$

- Recognize that there is an analogue to the species mass equation decoupling used in the flow solver
- Linear system can be decomposed as block jacobi scheme

# Decoupled Iterative Method

- Separate into two systems and solve as block jacobi scheme

$$\left( \frac{V}{\Delta t} \mathbf{I} + \frac{\partial \mathbf{R}_{\rho s}}{\partial c_s}^T \right) \Delta \Lambda_{c_s} = -\frac{\partial f}{\partial c_s} - \frac{\partial \mathbf{R}_{\rho s}}{\partial c_s}^T \Lambda_{c_s} - \frac{\partial \mathbf{R}_{\rho s}}{\partial \rho}^T \Lambda_{\rho} - \frac{\partial \mathbf{R}_{\rho s}}{\partial \rho \mathbf{u}}^T \Lambda_{\rho \mathbf{u}} - \frac{\partial \mathbf{R}_{\rho s}}{\partial \rho E}^T \Lambda_{\rho E}$$

$$\begin{aligned} & \left[ \frac{V}{\Delta t} \mathbf{I} + \begin{pmatrix} \frac{\partial \mathbf{R}_{\rho}}{\partial \rho}^T & \frac{\partial \mathbf{R}_{\rho}}{\partial \rho \mathbf{u}}^T & \frac{\partial \mathbf{R}_{\rho}}{\partial \rho E}^T \\ \frac{\partial \mathbf{R}_{\rho \mathbf{u}}}{\partial \rho}^T & \frac{\partial \mathbf{R}_{\rho \mathbf{u}}}{\partial \rho \mathbf{u}}^T & \frac{\partial \mathbf{R}_{\rho \mathbf{u}}}{\partial \rho E}^T \\ \frac{\partial \mathbf{R}_{\rho E}}{\partial \rho}^T & \frac{\partial \mathbf{R}_{\rho E}}{\partial \rho \mathbf{u}}^T & \frac{\partial \mathbf{R}_{\rho E}}{\partial \rho E}^T \end{pmatrix} \right] \begin{pmatrix} \Delta \Lambda_{\rho} \\ \Delta \Lambda_{\rho \mathbf{u}} \\ \Delta \Lambda_{\rho E} \end{pmatrix} = \\ & - \begin{pmatrix} \frac{\partial f}{\partial \rho} \\ \frac{\partial f}{\partial \rho \mathbf{u}} \\ \frac{\partial f}{\partial \rho E} \end{pmatrix} - \begin{pmatrix} \frac{\partial \mathbf{R}_{\rho}}{\partial \rho}^T & \frac{\partial \mathbf{R}_{\rho}}{\partial \rho \mathbf{u}}^T & \frac{\partial \mathbf{R}_{\rho}}{\partial \rho E}^T \\ \frac{\partial \mathbf{R}_{\rho \mathbf{u}}}{\partial \rho}^T & \frac{\partial \mathbf{R}_{\rho \mathbf{u}}}{\partial \rho \mathbf{u}}^T & \frac{\partial \mathbf{R}_{\rho \mathbf{u}}}{\partial \rho E}^T \\ \frac{\partial \mathbf{R}_{\rho E}}{\partial \rho}^T & \frac{\partial \mathbf{R}_{\rho E}}{\partial \rho \mathbf{u}}^T & \frac{\partial \mathbf{R}_{\rho E}}{\partial \rho E}^T \end{pmatrix} \begin{pmatrix} \Lambda_{\rho} \\ \Lambda_{\rho \mathbf{u}} \\ \Lambda_{\rho E} \end{pmatrix} - \begin{pmatrix} \frac{\partial \mathbf{R}_{\rho}}{\partial c_s}^T \\ \frac{\partial \mathbf{R}_{\rho \mathbf{u}}}{\partial c_s}^T \\ \frac{\partial \mathbf{R}_{\rho E}}{\partial c_s}^T \end{pmatrix} \Lambda_{c_s} \end{aligned}$$

# Outline

  - Decoupled Method
- 3 Cost and Memory Savings
  - Cost and Memory Savings of the Decoupled Flow Solver
  - Numerical Results: 2D Cylinder
  - Numerical Results: Axisymmetric Spherically Capped Cone
- 4 Adjoint Solver
  - Derivation of Discrete Adjoint Formulation
  - Fully Coupled Iterative Method
  - Decoupled Iterative Method
- 5 **Design Problem**
- 6 Concluding Remarks

# Design Problem: Hypersonic Retro Propulsion Vehicle

Annular nozzle mesh

Temperature Contour

- Apply adjoint to design Reaction Control System (RCS) jet system to shape shock interaction to maintain maximum drag at minimum surface temperature
- Desire a configuration where jet propellant mass is less than equivalent TPS material required
- This annular nozzle configuration has been shown to have a steady solution for inviscid flow

# Design Problem: Parameterization

- Design sensitivities given by

$$\frac{\partial L}{\partial \mathbf{D}} = \left\{ \frac{\partial f}{\partial \mathbf{D}} + \left[ \frac{\partial \mathbf{X}}{\partial \mathbf{D}} \right]^T \frac{\partial f}{\partial \mathbf{X}} \right\} + \left\{ \left[ \frac{\partial \mathbf{R}}{\partial \mathbf{D}} \right]^T + \left[ \frac{\partial \mathbf{X}}{\partial \mathbf{D}} \right]^T \left[ \frac{\partial \mathbf{R}}{\partial \mathbf{X}} \right]^T \right\} \boldsymbol{\Lambda}$$

- Define cost functions  $\Rightarrow f$ 
  - Total vehicle drag (with and without jet thrust contribution)
  - Total vehicle surface temperature (in lieu of heating, since these are inviscid simulations)
- Define design parameters  $\Rightarrow \mathbf{D}$ 
  - Plenum pressure
  - Plenum temperature
  - Jet placement and geometry
- Define mesh parameters  $\Rightarrow \mathbf{X}$ 
  - Custom grid generation utility
  - Facilitate all grid dependencies by wrapping in complex variables

# Design Problem: Grid Generation and Governing Equations

- Grid generation tool provides straightforward way to get mesh sensitivities
  - All parameters can be perturbed by a complex source term, and jacobian calculated via frechet derivatives
  - Structured mesh generation is fast and robust
  - Easy to convert to unstructured grid accepted by FUN3D
- Propose to limit research to inviscid flow, due to large jump in complexity going to full Navier-Stokes
  - Decoupled approach changes very little with addition of viscous terms
  - Viscous terms considerably more exhausting to implement
  - Grid generation process significantly more complicated
  - Scope of research is to demonstrate the new decoupled formulation for flow and adjoint solvers

# Outline

- 1 Introduction
- 2 Flow Solver
  - Fully-Coupled Method
  - Decoupled Method
- 3 Cost and Memory Savings
  - Cost and Memory Savings of the Decoupled Flow Solver
  - Numerical Results: 2D Cylinder
  - Numerical Results: Axisymmetric Spherically Capped Cone
- 4 Adjoint Solver
  - Derivation of Discrete Adjoint Formulation
  - Fully Coupled Iterative Method
  - Decoupled Iterative Method
- 5 Design Problem
- 6 Concluding Remarks

# Concluding Remarks

- Design problem provides good testbed for a truly unique hypersonic application
  - Parameterization is well defined
  - Non-linearity of design space is a concern
  - Optimal steady solution exists?
- Decoupling the species equations yield impressive benefits at minimal cost in robustness
  - 2 times faster and 1/3 required memory for both 2D Cylinder and Sphere-Cone 11-species cases
  - Convergence issues at very high velocities can be offset by scaling source term as solution progresses
- Decoupling appears promising for adjoint work
  - Preliminary testing has shown that memory overhead in adjoint is significantly reduced with decoupled scheme
  - Can expect similar speedup in adjoint solve

# Acknowledgements

- Thanks to the FUN3D team at NASA Langley Research Center, for their support in integrating aspects of the compressible gas path into the reacting gas path of FUN3D.
- Thanks to the Entry Systems Modeling Project within the NASA Game Changing Development Program for their funding and support of this research.

# Design Problem: Hypersonic Retro Propulsion Vehicle

Annular nozzle mesh

Temperature Contour

- Benefits of using RCS jet shape shock interaction to maintain maximum drag at minimum surface temperature
  - **Lower total mass:** Jet propellant mass is less than equivalent TPS material required
  - **Lower surface temperature:** Jet stream “shrouds” surface in cooler pocket
  - **Higher total drag:** Jet could propel combustible gas (i.e. methane) to ignite in shock layer and increase drag

# Backup: Derivation

- For the Roe flux difference splitting scheme, the species mass fluxes are given by

$$F_{\rho_s} = \frac{\rho_s^L \mathbf{U}^L + \rho_s^R \mathbf{U}^R}{2} - \frac{\tilde{c}_s(\lambda_1 dv_1 + \lambda_2 dv_2) + \lambda_3 dv_{3_s}}{2}$$

$$dv_1 = \frac{p^R - p^L + \tilde{\rho} \tilde{a}(\mathbf{U}^R - \mathbf{U}^L)}{\tilde{a}^2}$$

$$dv_2 = \frac{p^R - p^L - \tilde{\rho} \tilde{a}(\mathbf{U}^R - \mathbf{U}^L)}{\tilde{a}^2}$$

$$dv_{3_s} = \frac{\tilde{a}^2(\rho_s^R - \rho_s^L) - \tilde{c}_s(p^R - p^L)}{\tilde{a}^2}$$

$$\lambda_1 = | \tilde{\mathbf{U}} + \tilde{a} |, \quad \lambda_2 = | \tilde{\mathbf{U}} - \tilde{a} |, \quad \lambda_3 = | \tilde{\mathbf{U}} |$$

## Backup: Derivation

- The  $\tilde{\cdot}$  notation signifies a Roe-averaged quantity

$$\tilde{\mathbf{U}} = w\mathbf{U}^L + (1 - w)\mathbf{U}^R$$

$$w = \frac{\tilde{\rho}}{\tilde{\rho} + \rho^R}$$

$$\tilde{\rho} = \sqrt{\rho^R \rho^L}$$

- The species mass fluxes must sum to the total mass flux

$$F_\rho = \sum_s F_{\rho_s} = \frac{\rho^L \mathbf{U}^L + \rho^R \mathbf{U}^R}{2} - \frac{\tilde{c}_s(\lambda_1 dv_1 + \lambda_2 dv_2) + \lambda_3 dv_3}{2}$$

$$dv_3 = \frac{\tilde{a}^2(\rho^R - \rho^L) - (p^R - p^L)}{\tilde{a}^2}$$

# Backup: Derivation

- Substituting back into species mass flux equation

$$F_{\rho_s} = \tilde{c}_s F_\rho + \frac{(c_s^L - \tilde{c}_s)\rho^L(\mathbf{U}^L + |\tilde{\mathbf{U}}|)}{2} + \frac{(c_s^R - \tilde{c}_s)\rho^R(\mathbf{U}^R - |\tilde{\mathbf{U}}|)}{2}$$

- This can be simplified to yield a form similar to that derived by Candler, et. al for the Steger-Warming scheme

$$F_{\rho_s} = \tilde{c}_s F_\rho + (c_s^L - \tilde{c}_s)\rho^L\lambda^+ + (c_s^R - \tilde{c}_s)\rho^R\lambda^-$$

$$\lambda^+ = \frac{\mathbf{U}^L + |\tilde{\mathbf{U}}|}{2}, \quad \lambda^- = \frac{\mathbf{U}^R - |\tilde{\mathbf{U}}|}{2}$$

## Backup: Derivation

- Differentiating with respect to the mass fraction,  $c_s$ , the left and right state contributions are

$$\frac{\partial F_{\rho_s}}{\partial c_s^L} = w F_\rho + (1 - w) \rho^L \lambda^+ - w \rho^R \lambda^-$$

$$\frac{\partial F_{\rho_s}}{\partial c_s^R} = (1 - w) F_\rho + (w - 1) \rho^L \lambda^+ + w \rho^R \lambda^-$$

- Again, where  $w$  is the Roe-averaged density weighting

$$w = \frac{\tilde{\rho}}{\tilde{\rho} + \rho^R}, \quad \tilde{\rho} = \sqrt{\rho^R \rho^L}$$
